SUSTAINABILITY UPDATE

The world is getting smaller, but our ideas are only getting bigger. This reality forces us to face facts. **We only have one world!** A world that we want to enjoy for a long time and therefore we have to take care of it. As manufacturer of Industrial Fabrics, we are working on sustainability within our processes and products for years already. We acknowledge the facts and want to contribute to a better world.
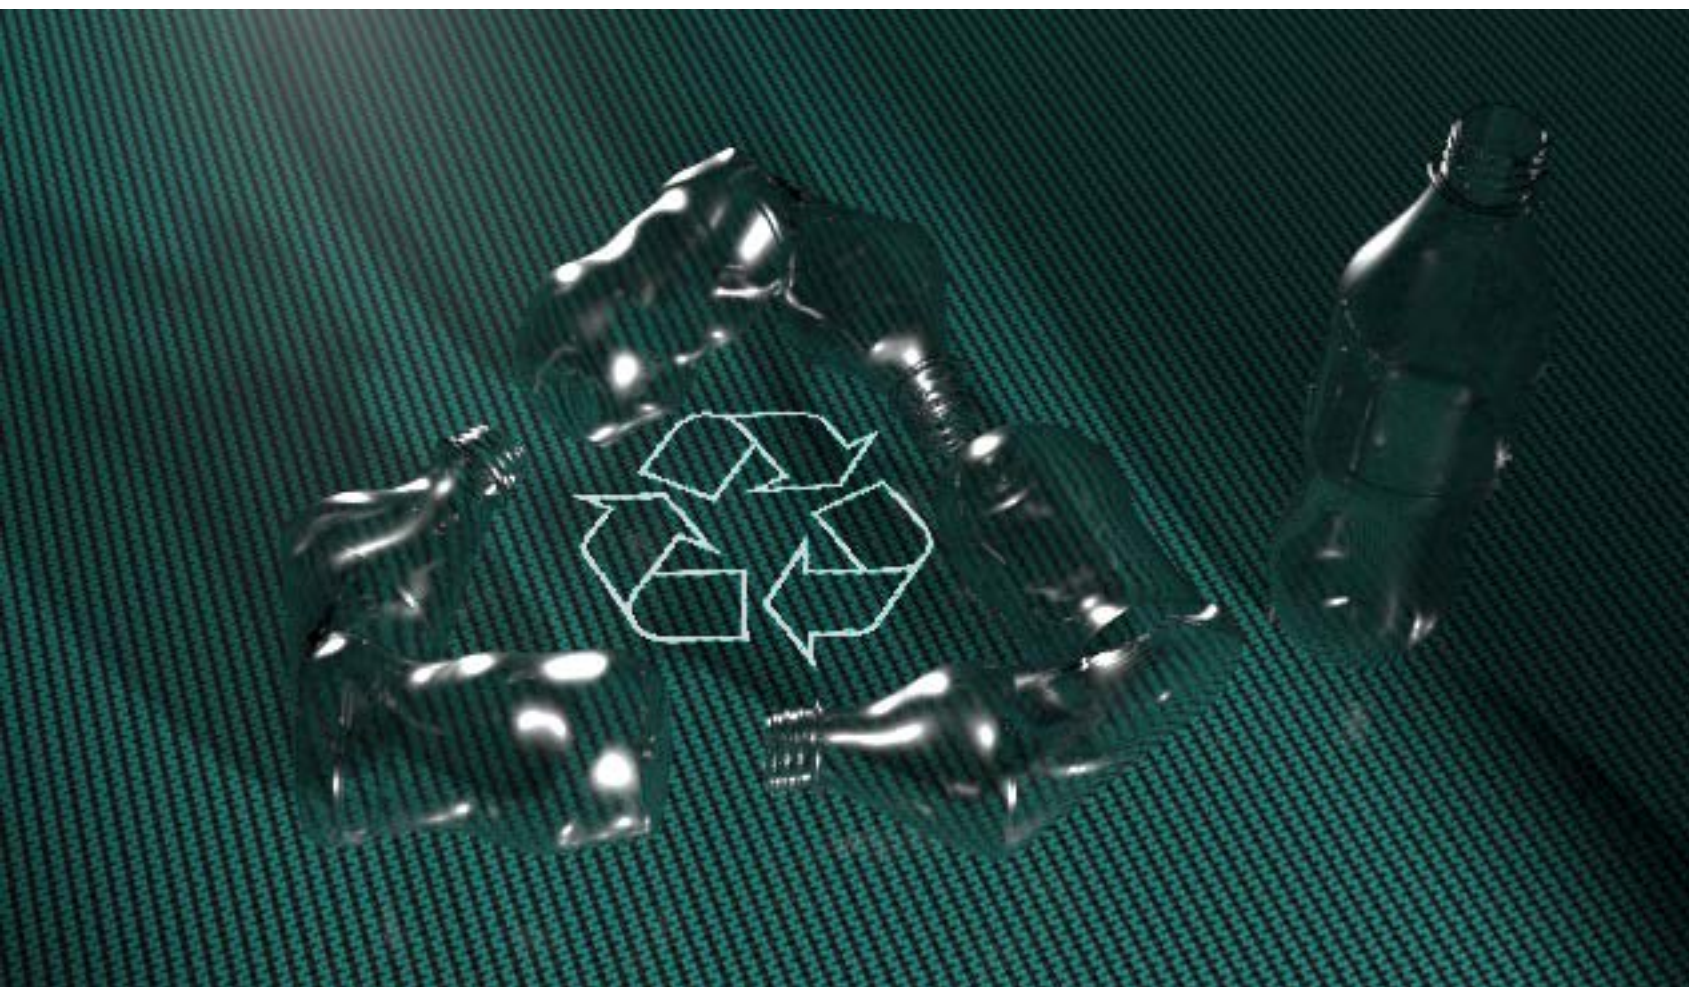

Full compliance

In addition to the use of our products we are always critical when it comes to the process. We are committed to ensure that all our factories and facilities are in full compliance with environmental regulations. You can be assured that we are doing our utmost to operate in a manner that protects the environment. Furthermore, we take the health and safety of our employees and the users of our products very serious.

Sustainable product innovations

Our goal is to develop products in the most sustainable way. The final product however needs to meet the requirements that are needed in the markets we serve. We are therefore actively following the developments with regard to recycling and biobased polymers in terms of process behavior, functionality and degradability and have already tested the first materials in relation to their suitability. We participate in (scientific) development programs around recycling of post-industrial materials and are testing biobased materials like sugar and other biobased polymers.

Let's share knowledge

Our experience shows that many applications of industrial fabrics contribute to less pollution, less waste and a longer lifespan of products. And we are happy to share this knowledge and experience, because together we are stronger. Together, we can take steps in the right direction better and faster. Together, we'll work on a world that lasts!

Do you want to explore the options or maybe your own ideas on sustainable use of industrial fabrics? Don't hesitate and just contact us!
